

# Additional Camera for Advanced Digital Wireless System

ADW-400

## Operating Instructions

# Before You Begin

## ■ **FCC Verification:**

**NOTE:** This equipment has been tested and found to comply with the limits for Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna
- Increase the separation between the equipment and the receiver
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
- Consult the dealer or an experienced radio/TV technician for help

## ■ **IMPORTANT NOTE: Prohibition against eavesdropping**

Except for the operations of law enforcement officers conducted under lawful authority, no person shall use, either directly or indirectly, a device operated pursuant to the provisions of this Part for the purpose of overhearing or recording the private conversations of others unless such use is authorized by all of the parties engaging in the conversation.

- **WARNING:** Modifications not approved by the party responsible for compliance could void user's authority to operate the equipment.

## ■ **IMPORTANT SAFETY INSTRUCTIONS:**

- Make sure product is fixed correctly and stable if fastened in place
- Do not operate if wires and terminals are exposed

- Power Extension Cable
- Screws and Mounting Hardware

# Overview

Congratulations on your purchase of this additional camera for the ADW-400 system! Adding more cameras to your ADW-400 system is a great way to achieve additional functionality and value from the ADW-400 receiver.

If you don't already have an ADW-400 Receiver, then you won't be able to use this camera. Talk to the retailer you purchased this camera from - they'll probably have them in stock. The camera and receiver are designed very much to operate as mutually dependent units, and can't be used with other cameras/receivers.

**Note:** This manual details the full function of the ADW-400 system, not just the camera included in this package. We've reproduced all the information in the original manual to save you the time and trouble of hunting down the old one.

*Here's a quick rundown on some of the great features the ADW-400 Camera and Receiver have to offer:*

## **Digital Wireless Technology**

No more interference! Unlike older analog wireless technologies which suffer greatly from signal distortion and interference, digital wireless technology provides clean, crisp images, even in environments with other wireless devices active.

## **Up to four channels (Quad View)**

Unlike older wireless systems which require a separate wireless receiver for each camera, the ADW-400 receiver is capable of receiving and displaying up to four cameras at once!

## **Night Vision**

With twenty-four infrared LEDs built into the camera, the ADW-400 can see up to 8m/26ft even in complete darkness, providing you with a 24 hour security solution.

## **SD Card Recording**

The ADW-400 Receiver is also a stand-alone video recorder, which saves video directly to SD cards. It will support SD cards up to 32GB, giving you a hassle-free

**Note:** for the best results, always use **high-speed, high-quality SD cards** which conform to either the SD or SDHC standards. Many lower quality SD cards with slower read/write speeds will not produce desirable results, as they cannot 'keep up' with the video being captured by the ADW-400.

# Layout of Camera

**Lens:** The business end of the camera. For a reliable and clear image, ensure that the lens stays clean and unobstructed. To clean, use a dedicated lens cleaning solution and cloth, available from all good photography stores.

**Infrared LEDs:** These give the camera its limited night vision capabilities. These LEDs act like a floodlight, but use light that human eyes cannot see, but which the camera can.

**Stand:** This stand can be pivoted to face any direction. Additionally, it can be attached to the camera via the screw thread on the rear of the camera, allowing for attachment high on a wall or to a ceiling.

**Antenna:** Used to transmit the wireless signal to the receiver. For the best results, the antenna should be as unobstructed as possible - ideally having a clear line of sight to the receiver.

# Layout of Receiver

**Power:** Activates and deactivates the receiver.

**MENU:** Opens the main menu, or goes back one step in a submenu.

**MUTE:** Turns the audio output on or off. Will not affect recording, only live monitoring and playback.

**QUAD:** Toggles between single channel view (where the image from one camera fills the whole screen) and quad view (where all four channels are displayed simultaneously, each taking 1/4 of the screen).

**Auto/Manual:** Press to change the channel being displayed in manual switching mode. Press and hold to toggle between manual switching and auto-switching mode.

**ARM:** Turns the motion detection based recording functions on or off. When the receiver is armed, it will automatically switch to QUAD view. You can subsequently exit QUAD view without disarming the receiver by pressing the QUAD button. For more information about recording and recording modes, see page 9.

**Play / Enter:** Starts and stops footage in playback mode. Acts as a Select / Enter

**Arrows / Playback Controls:** Used to navigate whilst in the menu system. In live viewing mode, UP is a shortcut to RECORD. In playback mode, DOWN is a shortcut to STOP, whilst LEFT and RIGHT are REWIND and FAST-FORWARD respectively.

**NOTE:** The Receiver is not a part of this package. To use the ADW-400 camera, you'll need to have the ADW-400 receiver already. The camera is not compatible with any other receiver or DVR system - they are designed to operate as one cohesive unit. If you've purchased this camera but don't have a receiver, ask the retailer you purchased this camera from about getting the dedicated receiver.

# Pairing

## Pairing Instructions

You might have already noticed that there is no channel switch on the camera – so, how do you assign the cameras to the channel you want? The answer is “pairing”.

Pairing, in a nutshell, is a process which associates one camera with one channel, hence “pairing” them together. There are no physical switches to worry about, the change is handled by the software in the receiver. The camera and receiver will retain their pairings even if the power is disconnected and restored.

### To pair a camera with one channel on the receiver:

- Press the MENU button on the receiver.
- Using the arrow buttons, navigate to “Pairing”.
- Press PLAY/ENTER.
- Using the LEFT and RIGHT arrows, choose the channel you would like to pair the camera to, from 1 to 4. Press PLAY/ENTER to confirm.
- Once you’ve selected the channel you’d like to pair a camera to, a countdown will appear on screen, counting down from 30.
- Whilst this countdown is in progress, press the pairing button on the rear of the camera you’d like to pair with this channel.

**Note:** Only one camera can be paired to a channel at a time, and pairing a camera to a channel which already has a paired camera will replace the previously paired camera.

The Main Menu with the Pairing Menu selected.

The Pairing Menu with the Channel 1 selected.

# Using the Menus

When you open the *Main Menu*, you will see the following four categories, each containing several options. Here's a quick rundown of what you'll see.

## Pairing

This is where you pair cameras with channels in the receiver. See page 7 for more details.

## Record

- *Auto-Delete*: Whilst Auto-Delete is turned on, and the SD card is full, the receiver will automatically delete the oldest event to have space to record a new event. If Auto-Delete is off and the SD card fills up, the receiver will no longer record.
- *Alarm Record Time*: The amount of time after a motion/alarm event that the receiver will continue to record for. You can set this time between 3 seconds and 10 minutes.
- *Time Stamp*: When Time Stamp is set to on the time and date of a recording will be overlaid on the video. We suggest leaving this set to on, as recording the time and date of an event typically makes the footage more useful.
- *Format*: Formats the SD card in the receiver. Formatting removes all data and re-writes the file allocation table. Only use this option if the SD card seems incompatible with the receiver, and/or you really want all data on the card to be erased.
- *Playback*: Enter playback mode (see pages 14 - 15).

## Schedule

- You can set a start and end time for the period that you want the receiver to record each day.
- Only one recording period can be defined each day. For the duration of the programmed schedule, the receiver will record continuously, regardless of whether there is movement in the camera's line of sight.
- For more information about Scheduled Recording, see page 11.

## Setting

Here you can access and set many of the settings in the receiver. You'll be able to adjust the date and time, your display settings, and alarm settings. For more details, see pages 12 - 13.

The *Main Menu* with the *Pairing Menu* selected.

The *Main Menu* with the *Record Menu* selected.

Layout of the *Record Menu* with *Auto Delete* selected.

The *Main Menu* with the *Schedule Menu* selected.

The *Main Menu* with the *Settings Menu* selected.

# Recording Modes

The ADW-400 Receiver offers two recording modes, *Motion Recording* and *Schedule Recording*. Both of these can be used together - that is, the receiver can always be ready to record on motion, and also record constantly for a certain period each day.

## Motion Recording

When *Motion Recording* is enabled, the receiver will record a short video file every time something moves in the line of sight of the camera. You can choose how long the receiver will continue to record for after a motion event has occurred.

To turn *Motion Recording* ON or OFF, press the ARM button on the top of the receiver. The *Motion Icon* will be displayed on screen whilst the receiver is armed for *Motion Recording*.

The *Motion Detection* icon.

The motion detection is sensitive enough to detect a human being (or human sized object/animal) moving at up to approximately 26ft (8m) from the camera. Smaller objects/animals proportionally closer to the camera, as well as larger things which are farther away. The criteria is how large things appear on the screen and how fast they are moving.

**Motion Alarm:** You can set the receiver to emit a high-pitch alarm tone when it detects motion.

The *Schedule* menu.

## Schedule Recording

You can have the receiver record constantly for a certain period each day. To set this up, access *Schedule* from the main menu.

Simply enter a start and end time. Use the left/right arrows to navigate, and up/down to change the values. Choose "On" to exit the schedule menu with Schedule recording active, or "Off" to exit the menu leaving schedule recording deactivated.

**Note:** If you set the schedule to record a long period each day, remember that you'll need to have a very large SD card in the receiver to store all that video data! If the card is smaller than the total file size, then you'll lose at least part of the recording, and possibly all of it.

# Connection Guide

1 Connect the power adapter plug into the power socket attached to the camera.

2 Plug the camera's power adapter into the wall socket.

## 5A. Connect to VCR/DVD recorder (Optional)

i Connect the A/V cable to the Input on the back of the VCR/DVD recorder

ii If your VCR/DVD recorder is not already connected to your TV, connect another A/V cable to the Output on the VCR

**5** Connect the the A/V cable to your TV or VCR

## 5B. Connecting to TV

From Receiver

**i** Connect the A/V Cable to a TV Input

From VCR  
(Optional)

# Settings

The Main Menu with the Settings Menu selected.

The Settings Menu with the Date/Time selected.

## Date / Time

Here you can update the date and time settings in the receiver to the correct values. The receiver will retain date and time information if turned off and on again, or if power is disconnected for a short time.

**Note:** The date is formatted as YYYY / MM / DD

## Brightness

Alter the brightness of the image displayed. There are five levels you can choose from, with 0 being the darkest and 5 being the brightest. Note that this setting won't help if you're looking into an area without sufficient illumination which is outside the range of the night vision.

## Volume

Adjust the output volume from the receiver. Again, this will not affect the recorded volume or allow the microphone in the camera to pick up sounds too soft for it to 'hear'. We suggest leaving the volume here at its default setting, and changing the volume on your TV/monitor.

## Scan Time

When Auto-Switching mode is activated, the Scan Time will adjust how long it will dwell on a channel before automatically switching to the next. This can be set between 3 and 10 seconds.

## Resolution

Resolution refers to how many pixels (individual dots which together make up an image) the receiver will record. There are two settings: low and high. High resolution records at VGA quality (640 x 480 pixels) and is the suggested setting.

## Alarm

The receiver can emit a high pitched alarm tone when it detects movement. This is great if you're using the ADW-400 to monitor an area in which there would be no frequent movement, but could very quickly become annoying if monitoring a main door or hallway. The alarm can be set to sound for 5 or 10 seconds, or not at all.

## Audio

Here you can turn the audio function of the receiver on and off. This functions in the same manner as the MUTE button on the receiver.

## Display Setup

You can select your video standard here, either PAL or NTSC. Only change this if the image on your TV/monitor is black and white or distorted.

**Note:** PAL is used in Western Europe and Australia, NTSC is used in North America and Japan.

## Version

This will display information about the receiver and cameras you have attached to your system. Specifically, this screen will tell you what version of the firmware/hardware they are running. There is little that you'll be able to do with this information, and nothing here is adjustable. The main reason you would access this window is if you contact our technical support team and they need to know what type of receiver and camera(s) you are using.

# Playback & Backup

There are two ways of playing back footage from the ADW-400 receiver. The first is through the receiver itself, and the second (possibly more useful option) is to remove the SD card and insert it into a card reader attached to a computer.

To back up footage, reading the SD card via a computer is the best option. Alternately, you could run the Video Out from the receiver into a VCR/DVD recorder and manually re-record your footage to a new medium (however, we recommend using the computer).

## Playback on the Receiver:

- Whilst viewing live images, press the Play/Enter button.
- Using the arrow buttons, navigate down to the VIDEO folder.
- Each folder represents a date on which recordings were done.
- Individual recordings are listed by time, formatted as HHMMSS. For example, a recording taken at two-thirty and twelve seconds will be named "143012\_1".
- The UP and DOWN arrows will navigate through the list one video or folder at a time. The LEFT and RIGHT arrows are quick navigation options, and scroll one page at a time.
- Simply click on the video you want to play it.
- The arrow buttons are the playback controls: left and right are fast-forward and rewind respectively, and down is stop.
- To return to the file list, press MENU.
- To exit the file list, also press MENU.

The *Playback Interface* with a list of dates. The range in this example is from the 1<sup>st</sup> to the 3<sup>rd</sup> of January, 2009.  
YY-MM-DD

The *Playback Interface* with a list of individual recordings. These are very short recordings recorded at 7:26 a.m.

## Playback & Backup on a Computer:

Playback on a PC has some significant advantages over playing back footage on the receiver itself.

Generally, computer playback offers a higher resolution monitor than most TVs, and the video quality does not suffer from being transmitted via a composite video signal.

### To playback footage on your computer:

- Remove the SD card from the receiver.
- Insert the SD card into a card reader attached to your computer.
- Open the SD card in your file browser (such as Explorer).
- Open the folder named "Video".
- Each folder represents a date on which recordings were done.
- Individual recordings are listed by time, formatted as HHMMSS. For example, a recording taken at two-thirty in the afternoon and twelve seconds will be named "143012\_1".

**Note:** If you do not have an SD card reader in your computer, you can purchase a separate card reader. These are quite inexpensive and, using USB technology, allow for quick "plug & play" installation.

### Backup onto a PC

Once you've popped the SD card into a card reader connected to your computer, the video files can be copied as per any other file. This is great for quick and easy backing up footage.

To burn a DVD of your footage which will work in a stand-alone DVD player, you'll need to use a dedicated DVD authoring program. However, if it is simply for the purpose of backing up footage to play on a computer, then burning the file as is to a data DVD will suffice.

If you have difficulty playing back footage on your computer, we suggest using a different player. VLC player (available online at [www.videolan.org/vlc](http://www.videolan.org/vlc)) is a free program which will can play files created on the ADW-400 without additional software or codec packs.

# Additional Features

## Quad View:

In Quad View mode, you'll be able to see images from up to four cameras on screen at once. For this to function optimally, you'll need:

- Four ADW-400 cameras,
- connected to power,
- and each correctly paired to each of the four channels.

To enable quad viewing mode, simply press the QUAD button on the top of the receiver.

**Whilst in Quad Viewing mode, some of the buttons on the receiver will no longer be active - most notably, the MENU button will not be active.** This is because decoding four video signals simultaneously uses the maximum processing capacity of the miniature computer in the receiver and there is insufficient processing power to display the menus. To exit Quad Viewing Mode, simply press the QUAD button again. The full functionality of the MENU button will instantly return.

You'll be able to enter Quad Viewing Mode even if there are fewer than four cameras paired with the receiver. In this case, there will simply be a blank space where that image would otherwise be displayed.

## Auto Delete:

Whilst the Auto Delete function is turned ON, the ADW-400 will automatically delete old files when it runs out of space on the SD card.

As a result, we suggest checking the recording lists periodically to ensure you don't lose an important event. (Of course, depending on your unique situation, it may be extremely obvious when an incident has occurred.)

If *Auto Delete* is turned off, when the SD card fills up, that's it - new events cannot and will not be recorded. For most implementations, it's usually better to be able to record events as they happen at the risk of losing old ones than vice versa. However, this is something that you'll need to determine based on your unique situation. ***If Auto Delete is turned on and there is a particular incident that you want to backup, you'll need to copy it off the SD card before it is overwritten!***

The *Auto Delete* icon will be displayed on the screen while Auto Delete is switched on.

## Recording Time:

If you were to manually set the ADW-400 to record constantly, how long will it record for? Under ideal conditions, the ADW-400 uses a minimum of 8MB of space per minute of recording.

Accordingly, we suggest that a 2GB SD card should only be relied on to record approximately 3 hours (even then, there is a chance that the video might be too large).

**To avoid filling your SD card unnecessarily, we strongly suggest using the *Motion Detection* recording mode. This way, the cameras will only record when there's something to see, and you can ensure that the space on your SD card is being used optimally.**

Remember that if you have the *Auto Delete* function active, the unit will automatically record over the oldest files when it runs out of space. This is important if there is a particular incident that you want to backup - you'll need to copy it off the SD card before it is over-written!

## Manual Channel Changing and Auto-Switching

The default channel mode for the ADW-400 is Manual Channel Switching. When channel switching is set to manual, simply press the Auto/Manual button to cycle through available channels. The Manual icon will be displayed on the screen to let you know that the ADW-400 is in this mode.

The Manual Switching Icon

You can set the ADW-400 receiver to automatically switch between all available channels. To change the mode, simply press and hold the Auto/Manual button for five seconds. The M icon will change to an "S" to let you know that the ADW-400 is in Auto-Switching mode.

The Auto-Switching Icon

# Troubleshooting Guide

**Problem:** I'm getting a "NO SIGNAL" message on my screen where I want to see my images.

**Solutions:**

1. Make sure the camera is getting power from the supplied 5V power adaptor.
2. Ensure that the camera is properly paired with the receiver by following the instructions on page 7.
3. Check that the channel you are displaying is the one paired with the camera.
4. If all else fails, try moving the camera closer to the receiver, and be sure there are no obstacles (such as thick walls or metal sheets) in between the camera and the receiver blocking the signal.

**Problem:** When I view the footage from the camera at night, I see a bright white spot and no image.

**Solution:** Having the camera looking out a window is problematic, as the glass will reflect the infrared beams from the LEDs, over-exposing your image. Move the camera so that there are no barriers (even transparent barriers such as glass) between the camera and what you want to see. Also, make sure there are no objects within 3'/1m of the lens, as these can reflect the infrared beams as well.

**Problem:** I can't hear any sound on my TV.

**Solution:** Check the connections between the receiver and the TV, specifically the red and/or white connector(s) are plugged in correctly. Check the volume settings on the TV. Also, remember that the range of the microphone is not the same as the range of the camera – the camera will record anything in front of it that it sufficiently lit, however a microphone will only record sound within a few feet (unless the sound is very loud).

**Problem:** The image on my TV appears to be distorted.

**Solution:** Check the PAL/NTSC settings on your television are correct for your region (NTSC for USA and Canada, PAL for Australia and Western Europe). If this does not fix the problem, check the connections between the receiver and your screen. If you are using a long RCA cable (anything over 6'/2m) try using a shorter one, particularly if there are other electrical devices located close to the TV and receiver.

**Problem:** At night, the camera can only see 26'/8m.

**Solution:** This is not a malfunction – this is the range of the infrared beam that the camera uses to see at night. Move the camera closer to what you wish to view. Alternately, you could purchase and install a sensor floodlight, which are available at most good hardware stores.

# Technical Specifications

## Advanced Digital Wireless (ADW) Camera

### Video

Image Sensor	1/4" CMOS
Video Quality	300 TV Lines
Number of Effective Pixels	VGA: 640 x 480
Minimum Illumination	0 Lux (IR On)
Day / Night Mode	Color during day, switches to B&W at night
White Balance	Automatic
Signal / Noise Ratio	<45dB
Electronic Shutter	NTSC: 1/60 ~ 1/15, 000 PAL: 1/50 to 1/15, 000 (Automatic)
Gain Control	Automatic
Backlight Compensation	No
Lens	3.6mm
Viewing Angle	53 degrees

### Audio

Microphone	Yes
Audio Range	Approximately 9ft / 3m (under typical conditions)

### Night Vision

Night Vision Range	Up to 26ft / 8m
Infrared Cut Filter	No
Number of IR LEDs	24
Infrared Wavelength	850nm
Infrared LED Life	10, 000 hours

### General

Operating Power	DC 5V
Operating Temperature	-10°C ~ 50°C / -14°F ~ 122°F
Body Construction	ABS Plastic
Dimensions of Camera	5.1" x 2.6" x 2.6" / 130mm x 65mm x 65mm
Dimensions of Stand	4.7" x 2.4" x 2.4" / 120mm x 60mm x 60mm
Weight (Camera and Stand)	7.6 oz / 215g

### Wireless

Digital or Analog	Digital
Max. Transmission Range	Up to 165 ft / 50m
Typical Range	65 ft / 20m
Frequency	2.4 GHz FHSS (Frequency hopping)
Transmission Channels	4

## Receiver / SD Card Recorder (NOT INCLUDED - For Reference ONLY)

Video	NTSC or PAL
Video Format	N/A (via ADW-400 Camera only)
Video Inputs	1 x RCA Composite Video
Video Outputs	VGA: 640 x 480 QVGA: 320 x 240
Display Resolution	VGA: 9 fps QVGA: 25 fps
Display Frame Rate	

### Audio

Audio Input	None (via Camera only)
Audio Output	1 x RCA Line Out

### Recording

Compression Format	Motion JPEG
Recording Resolution	VGA: 640 x 480 QVGA: 320 x 240
Recording Frame Rate	16fps
Recording Modes	Manual / Motion
Memory Type	SD Card up to 32GB (SDHC compatible)

### General

Operating Power	DC 5V
Dimensions	5.3" x 3.9" x 1.0" 135mm x 100mm x 25mm
Weight	5.8oz / 165g
Backup Method	SD Card

## Warranty Information

Swann Communications USA Inc.

12636 Clark Street

Santa Fe Springs CA 90670

USA

Swann Communications PTY. LTD.

Building 4, 650 Church Street,

Richmond, Victoria 3121

Australia

Swann Communications warrants this product against defects in workmanship and material for a period of one (1) year from its original purchase date. You must present your receipt as proof of date of purchase for warranty validation. Any unit which proves defective during the stated period will be repaired without charge for parts or labour or replaced at the sole discretion of Swann. The end user is responsible for all freight charges incurred to send the product to Swann's repair centres. The end user is responsible for all shipping costs incurred when shipping from and to any country other than the country of origin.

The warranty does not cover any incidental, accidental or consequential damages arising from the use of or the inability to use this product. Any costs associated with the fitting or removal of this product by a tradesman or other person or any other costs associated with its use are the responsibility of the end user. This warranty applies to the original purchaser of the product only and is not transferable to any third party. Unauthorized end user or third party modifications to any component or evidence of misuse or abuse of the device will render all warranties void.

By law some countries do not allow limitations on certain exclusions in this warranty. Where applicable by local laws, regulations and legal rights will take precedence.
