

D-Line Fixing Instructions... Please read.

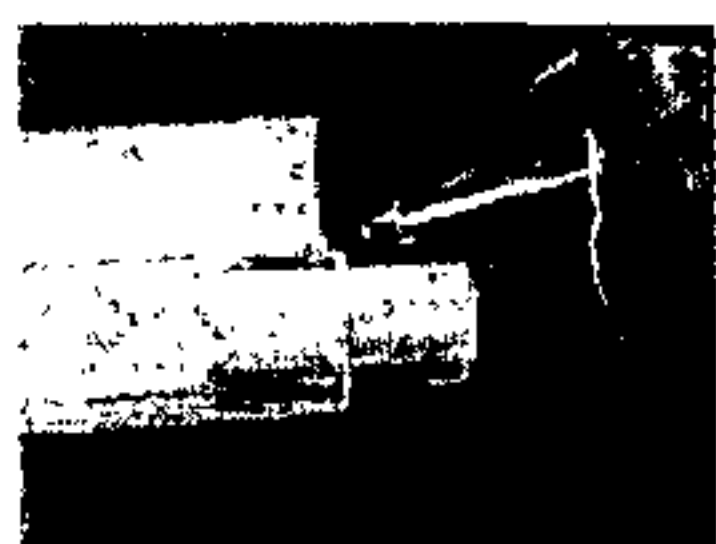

1. Measure length required. Hold cutting-guide over D-Line and cut where necessary using a Tenon Saw or Hacksaw with a fine-tooth blade.

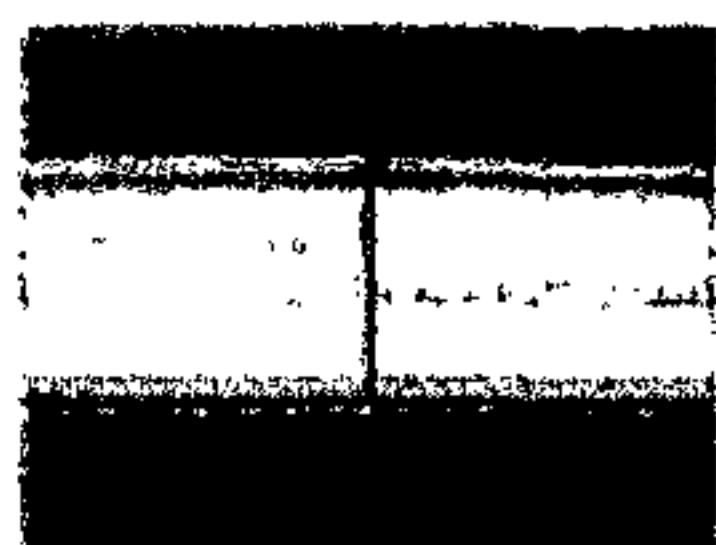

2. For easier installation we advise horizontal runs (incl Quarter Sphere D-Line) are all fixed with clip-opening at top and the hinge at base.

3. For best results we recommend the lengths are fixed with screws. If using self-adhesive option only, please be advised a strong bond will be achieved with the surface.

- 4a. Before fixing D-line lengths, remember the accessories! When using accessories temporarily fit the relevant accessory part where required. Mark the surface to identify fixing point of next D-Line length.

- 4b. Remove accessory to leave space. Position the next D-Line length. After fixing cables the accessory can be retro-fitted into the space.

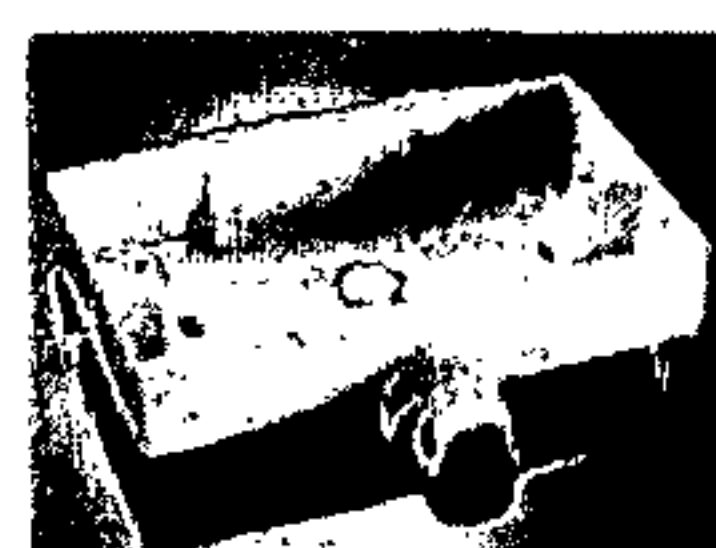

- 5a. When using flat or internal bends, first position the bend. Next mark the wall at shoulder of the bend (a & b) and cut the D-Line to suit.

- 5b. Position trunking to enable wiring to be completed. The bend can then be retro-fitted.

6. When fitting external bends ensure corner sections are touching then later fit the bend over cables.

7. When fitting switch and socket boxes fix the D-Line 30mm x 15mm box adaptor (or tee adaptor) before the box is fitted to the surface. Enclose open ends with D-Line end caps.

8. To add (or remove) cables D-Line should be opened by downward and outward pressure on the lid near the clip opening.
